                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                               AAF71753 to AAF72330 encode the Corynebacterium glutamicum metabolic pathway (MP) proteins given in AAB79634 to AAB80211. The C. glutamicum MP nucleic acids are useful for the production of fine chemicals in microorganisms, incorpanic acids, nonproteinogenic amino acids, purine and pyrimidine bases, nucleosides, nucleotides, lipids, saturated and unsaturated fatty acids, diols, carbohydrates, aromatic compounds, vitamins, cofactors, polyketides and enzymes.
                                                                                                                                                                                                                                                                                                                                                   pathway proteins, useful for producing fine chemicals in microorganisms, including organic acids, nonproteinogenic amino acids, and purine and pyrimidine bases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               418 caactggacactttgctctcaatcattgatgaaggcagcttcgaaggcgcctccttagcc 477
                                                                          This DNA sequence comprises Mycobacterium bovis BCG deletion sequence BCGdelta2. A specific genetic deletion of this region results in an avirulence phenotype of the mycobacterium. 2 Other deletion regions (see AAT33535 and AAT33537) have also been detected. Identification involved screening a BCG cosmid library with a radiolabeled probe obtained following DNA subtraction between virulent Mycobacterium tuberculosis H37Rv and avirulent BCG.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    the deletion; the deletions are detected either by detecting the presence or absense of deletion junctions (see AAT33538-46), or by detecting the presence or absence of the sequences contained within the deletion. Deletion polypeptides are used as components of
                                                                                                                                                                                                                                                                                                                                                                        The deletions provide useful markers for the identification of an avirulent, or a virulent, mycobacterial phenotype. Determination of avirulence requires the detection of the presence or absence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                6;

                                                                                                                                                                                                                                                                                                   The present sequence is the yggA gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increase accumulation of amino acids in the cell. In this case, an increase in arginine, glutamic acid and lysine is achieved if multiple copies of the gene are transfected into a bacterium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               production of L-amino acids by an Escherichia bacterium increasing the expression amount of an L-amino acid excretion

The present invention relates to a Moraxella catarrhalis genomic library comprising of a combination of 41 nucleic acid molecules (see AAF28514-AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                                                                                                                                                         Genomic library for identifying diagnostic and therapeutic compositions, and for identifying virulence factors, regulatory elements and drug targets, comprises Moraxella catarrhalis nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 45613;

The invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a probe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA from a sample suspected of containing a stealth virus, e.g. a culture of cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 or more contiguous nucleotides identical to sequence previously ledentified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA molecules that react with the probe. The method is used to detect stealth virus in a biological product, food or in the previous of the method is also used to evaluate agents for their
                                                                             Inhibitory or stimulatory effects on stealth virus replication and to determine capacity of the virus to recombine with and potentially alter the nucleic acid sequences of a cell or bacterium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                244 ttaattccttgtttaatcaccagtacattctgcggtccgatggacagtaaaagactggcc 303

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          group, useful as labels in allowing repeat analyses on
                                                                                                                                                       The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (ETM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

Nucleic acids containing electron-transfer group, useful as labels in hybridization assays, e.g. for genotyping, allowing repeat analyses on a single surface
                                                                                                                                                                                                                                                                                                                    The present invention relates to a composition comprising two nucleic acids each containing an electron-transfer group (FTM) having different redox potentials. The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

The invention is used for electronic detection of nucleic acids, especially of substitutions (mismatches) and single-nucleotide polymorphisms, e.g. for genotyping,

                           This sequence is the Orf3 protein product, involved in lysine production. Ly65 and Ly8E encode a lysine transport regulatory protein and an export protein, respectively. Microbial production of amino acids (A) is improved by increasing the export-carrier activity and/or the export gene expression in a microoraganism that produces (A). The method is specifically used to increase production of lysine, used as an animal feed additive. Other (A) are variously useful as pharmaceuticals, condiments and intermediates for fine chemicals. This method increases the amount of (A) secreted into the culture medium. Export of (A) has been found to depend on a single gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      membrane construction and membrane transport protein; petroleum spill; hydrocarbon degradation; gram positive aerobic bacterium; marker; identification; microorganism; fine chemical production; transformation;

AAF67743 to AAF68080 encode the Corynebacterium glutamicum membrane construction and membrane transport (MCT) proteins given in ABB76510 to AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. Brevibacterium lactofermentum), the typing or identification of C. glutamicum or related bacteria, as reference points for mapping C. glutamicum genome, and as markers for transformation. AAF68082 and AAF68082 represent sequencing primers which are used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Corynebacterium glutamicum nucleic acids encoding membrane construction and membrane transport proteins or their portions, useful for typing or identifying C. glutamicum or related bacteria, and as markers for transformation .

treatment of

Kuzuyama T;

Seto H,

The present invention describes the preparation of an isoprenoid compound comprising at least 1 DNA e.g. encoding proteins which elevate the efficiency of the synthesis or DNA encoding a farnesyl pyrolinic producing enzyme. The method of preparation of an isoprenoid compound comprises using at least 1 DNA, a vector, cloned cells, their derivative recombinant DNAs or transformed products in a culture system and extracting the isoprenoid accumulated in the medium. The DNA encodes at least 1 of the following: (a) a compound for activating or catalysing the production of 1-deoxy-b-xylulose-5-phosphate from pyruvic acid and glycerylalehyde-3-phosphate; (b) an enzyme producing farnesyl pyrolinic acid; (c) a protein which elevates the efficiency of synthesis of isoprenoid compounds and comprises a 3 or 4 amino acid sequence optionally with 1 or more of the amino acids being deleted or substituted or an additional amino acid being inserted; (d) a protein which activates or catalyses the production of 2-C-methyl-b-erythraticol-compound actalyses the production of 2-c-methyl-b-erythraticol-compound actalyses the production of 2-c-methyl-b-erythraticol-compound or reaction and is a string end or hybrid activates a target compound or reaction and is a string end or hybrid of the presenting coarings. The isoprenoids also inhibit enzymatic reactions antifouling coatings. The isoprenoids also inhibit enzymatic reactions of herbicides. The present sequence is used in the exemplification of the present invention.

This polypeptide sequence Kv beta 1 consists of the core region of a beta-subunit of a Shaker-like potassium ion channel (SPC). This core region can bind to a polypeptide consisting of the N-terminal A and B box (NAB) domain and the NAB-S1 (the first transmembrane spanning domain linking region of the alpha-subunit of SPC. The polypeptides or the nucleic acid encoding them can be introduced into the cytoplasm of a cell to modulate the flow of potassium ions through a cytoplasmic cell 156 ntpieetlealndvvkagkaryigassmhasqfaqalelqkqhgwaqfvsmqdhynliyr 215 Shaker-like potassium ion channel beta-subunit core region Kv beta 1. Polypeptide(s) derived from Shaker-like potassium ion channel alpha and beta subunits - used to alter potassium ion levels in a cell, e.g. for treating neurological disorders, tumours, metabolic disease Shaker-like potassium ion channel; SPC: beta subunit; core region; Kv beta 1; N-terminal A and B box; NAB; treatment; cardiac disease; tumour; auto immune disease. membrane. Potcassium in channels regulate the action potentials, cardiac pacemaking and neurotransmitter release in excitable tissues. In non-excitable tissues they play important roles in hormone secretion, cell proliferation, cell volume regulation and lymphocyte differentiation. Molecules which bind to the alpha or beta-subunit polypeptides can be detected by contacting the polypeptides, with a putative NAB and NAB-51 linking region of an alpha-subunit or with a putative core region of a beta-subunit respectively, and determining whether or not binding occurs. These polypeptides and the encoding disorders, e.g. neurological disorders, tumours, metabolic diseases, cardiac disease and autoimmune disease,

This core region can bind to a polypeptide consisting of the N-terminal A and B box (MAB) domain and the NAB-SI (the first transmembrane spanning domain) linking region of the alpha-subunit of SPC. The polypeptides or the nucleic acid encoding them can be introduced into the cytoplasm of a cell to modulate the flow of potassium ions through a cytoplasmic cell membrane. Potassium ion channels regulate the action potentials, cardiac pacemaking and neurotransmitter release in excitable tissues. In con-excitable tissues they play important roles in hormone secretion, cell proliferation, cell volume regulation and lymphocyte differentiation. Molecules which bind to the alpha or beta-subunit polypeptides can be detected by contacting the polypeptides, with a

                                                                                                                                                                                                                       ò
                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  metabolism and oxidative phosphorylation (SMP) proteins given in AAB79243 to AAB 79633 which are involved in carbon metabolism and energy production. The C. glutamicum SMP gene can be used in vectors (II) for expression in host cells and production or modulation of production of fine chemicals, such as, an organic acid, a proteinogenic anino acid (preferred), a purine or pyrimidine base, a nucleoside, a nucleotide, a lipid, a saturated or unsaturated fatty acid, a diol, a carbohydrate, an aromatic compound, a vitamin, a cofactor, a polyketide, or an enzyme. The presence of (I) or SMP proteins (III) encoded by them are used for diagnosing the presence or activity of Corynebacterium diphtheriae in a subject. (I), (II), (III) or host cells containing them are used to map genomes of organisms related to C. glutamicum, identify and localise C. glutamicum sequences of interest,
fine chemical production; organic acid; proteinogenic amino acid; nonproteinogenic amino acid; purine base; pyrimidine base; nucleoside; nucleotide; lipid; saturated fatty acid; unsaturated fatty acid; diol; carbohydrate; aromatic compound; vitamin; cofactor; polyketide; enzyme; diagnosis; Corynebacterium diphtheriae; evolutionary study.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated Corynebacterium glutamicum nucleic acid encoding a sugar metabolism and oxidative phosphorylation protein for production or modulation of production of fine chemicals e.g. amino acids, carbohydrates or enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAF71360 to AAF71750 encode the Corynebacterium glutamicum sugar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Haberhauer G;

                                                                                                                                              AAF67743 to AAF68080 encode the Corynebacterium glutamicum membrane construction and membrane transport (MCT) proteins given in AAB76510 to AAB76847. The MCT nucleic acids and proteins are useful in the identification of microorganisms which can be used to produce fine chemicals, for modulating fine chemical production in C. glutamicum or related bacteria (e.g. glutamicum or related bacteria, as reference points for mapping C. glutamicum or related bacteria, as reference points for mapping C. glutamicum, and as markers for transformation.

AAF68082 and AAF68082 represent sequencing primers which are used in an example from the present invention.
                                                                  Corynebacterium glutamicum nucleic acids encoding membrane construction and membrane transport proteins or their portions, useful for typing or identifying C. glutamicum or related bacteria, and as markers for transformation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence; corn.
